

## What is Maven:

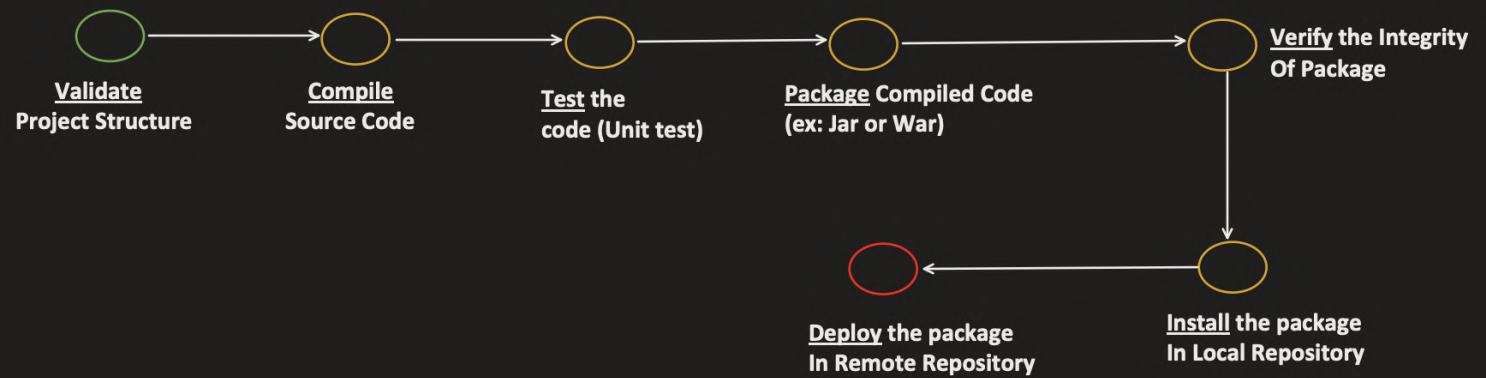

- It's a project management tool. Helps developers with:
  - Build generation
  - Dependency resolution
  - Documentation etc.
- Maven uses POM (Project Object Model) to achieve this.
- When "maven" command is given, it looks for "pom.xml" in the current directory & get needed configuration.

**Maven Build lifecycle phases:**

- If you want to run "package" phase, all its previous phase will get executed first.
- And if you want to run specific goal of a particular phase, then all the goals of previous phases + current phase goals before the one you defined will get run.

Maven already has Validate phase defined and its goal, but if we want to add more goals or task, then we can use `<build>` element. And add the goal to specific phase.

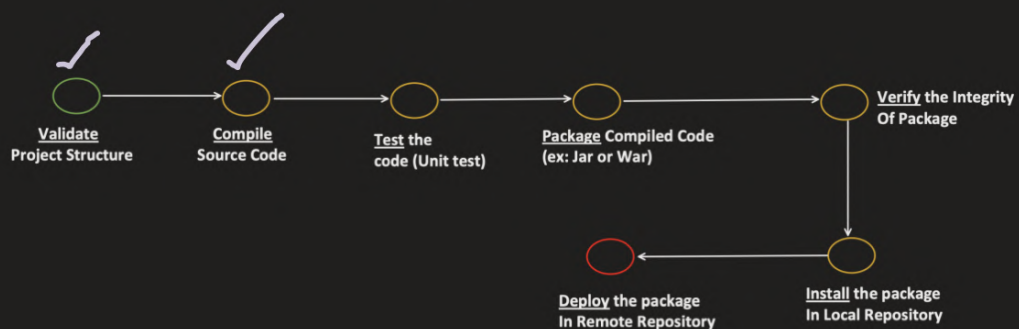

Validate :

**mvn validate**

```
<plugin>
  <groupId>org.apache.maven.plugins</groupId>
  <artifactId>maven-checkstyle-plugin</artifactId>
  <version>3.1.2</version>
  <executions>
    <execution>
      <id>validate-checkstyle</id>
      <phase>validate</phase>
      <goals>
        <goal>check</goal>
      </goals>
    </execution>
  </executions>
  <configuration>
    <configLocation>myCodeStyle.xml</configLocation>
  </configuration>
</plugin>
```

Compile:

**Run the command: mvn compile**

It will validate and compile your code and put it under **`${project.basedir}/target/classes`**

```

            - > Controller
            - > DTO
            - > Entity
            - > Repository
            - > Service
            - Ⓢ SpringBootApplication
          - 📄 application.properties
        - > generated-sources
        - > maven-status

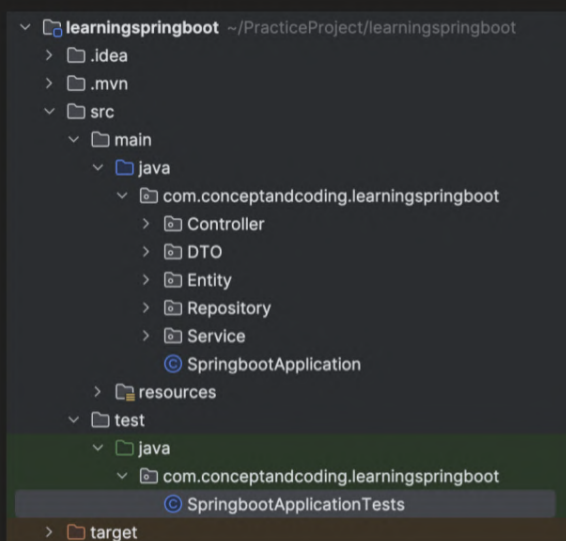

Previously, "**Ant**" was popular, there we have to tell what to do and also how to do.

```
<project default="compile">
<target name="compile">
//some other properties here
<javac destdir="{provide your destination directory}">
<src>
<pathelement location="src/main/java"/>
</src>
//some other properties here
</javac>
</target>
</project>
```

**Test:** `mvn test`

It will validate, compile and then run the TEST cases in your project.

```
1 package com.conceptandcoding.learningspringboot;
2
3 > import ...
4
5
6 @SpringBootTest
7 > class SpringbootApplicationTests {
8
9     @Test
10 > void contextLoads() {
11
12         System.out.println("CONCEPT && CODING : TEST CASE RUNNING");
13     }
14
15 }
16
```

```

**Package:** `mvn package`

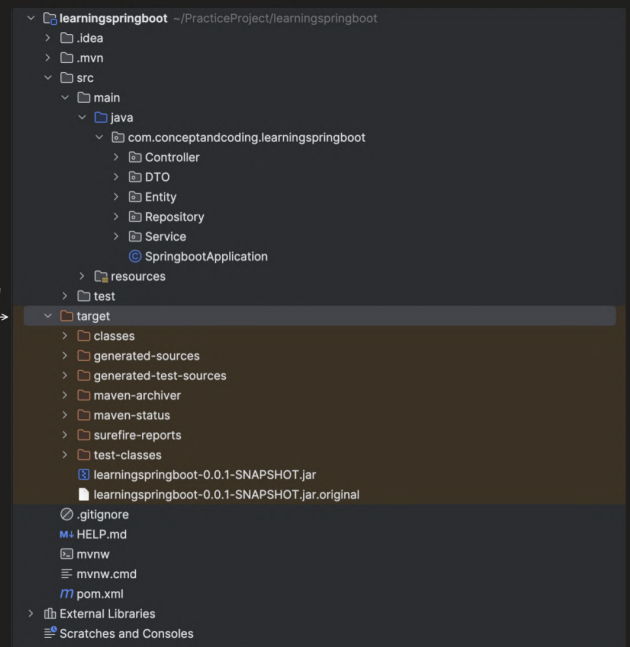

First complete Validate, Compile, Test phase and then run Package phase in which it Generates .jar or .war file.

[illegible]

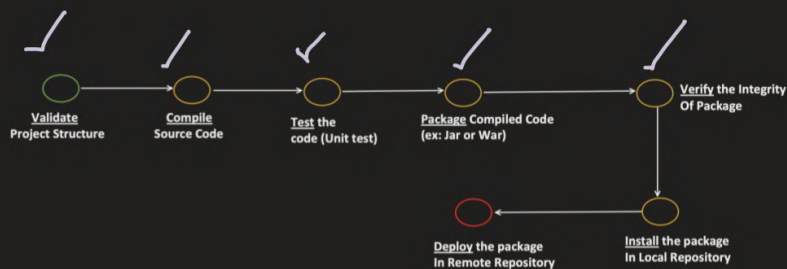

After "mvn package"

**Verify:**

`mvn verify`

It can perform some additional checks apart from unit test cases like:

- STATIC CODE ANALYSIS
- CHECKSUM VERIFICATION etc...

#### STATIC CODE ANALYSIS:

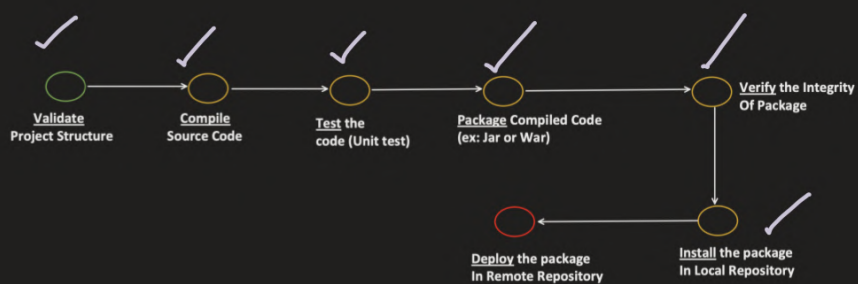

```
<plugin>
  <groupId>org.apache.maven.plugins</groupId>
  <artifactId>maven-pmd-plugin</artifactId>
  <version>3.21.2</version>
  <executions>
    <execution>
      <id>pmd-analysis</id>
      <phase>verify</phase>
      <goals>
        <goal>pmd</goal>
      </goals>
    </execution>
  </executions>
</plugin>
```

PMD is a source code analyzer:

- Finds unused variable
- Finds unused imports
- Empty Catch block
- No usage of object
- Finds duplicate code etc...

**Install:**

`mvn install`

It will install the .jar package in local Maven Repository.  
which is typically located in your user home directory (~/.m2/repository)

#### settings.xml (in .m2 folder)

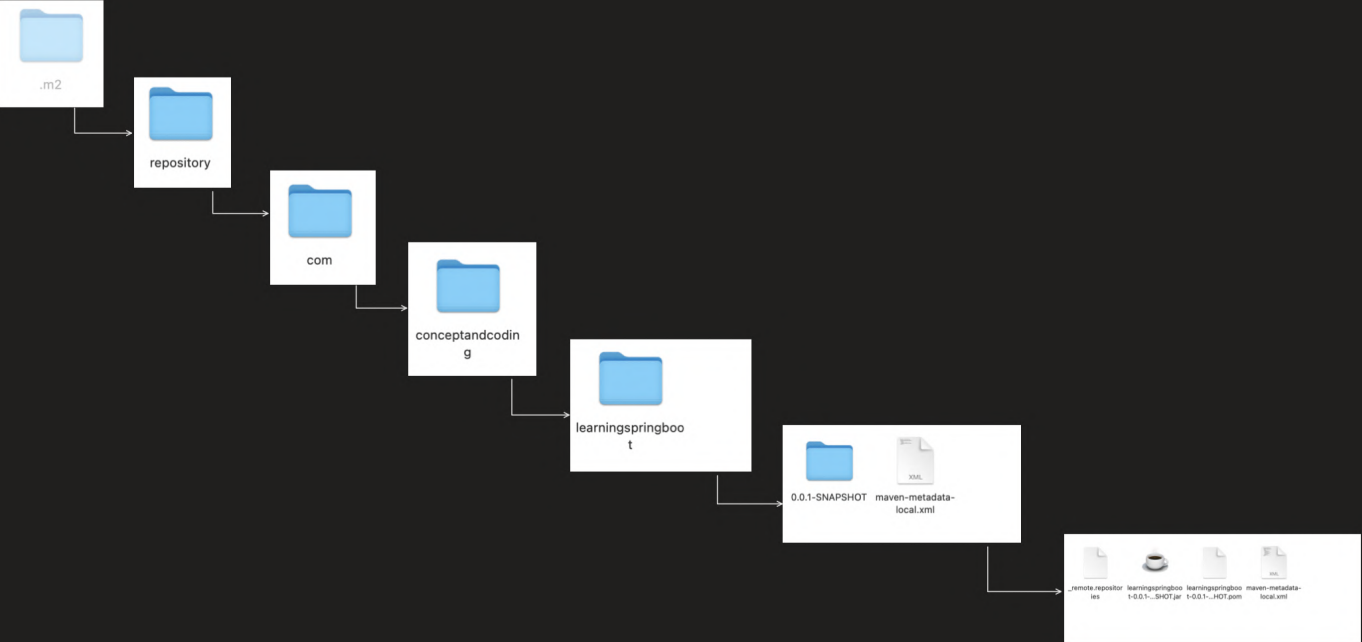

```
<settings xmlns="http://maven.apache.org/SETTINGS/1.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/SETTINGS/1.0.0
    http://maven.apache.org/xsd/settings-1.0.0.xsd">

  <!-- Local Repository: Location where Maven stores downloaded artifacts -->
  <localRepository>${user.home}/.m2/repository</localRepository>

  <!-- some other configurations goes here -->

</settings>
```

[illegible]

**Deploy:** `mvn deploy`

It will deploy the .jar to REMOTE Repository

**pom.xml**

```
<project>
  <!-- ... other project configurations ... -->

  <distributionManagement>
    <repository>
      <id>remote repository id</id>
      <url>https://remote-repository-url</url>
    </repository>
  </distributionManagement>

  <!-- ... other pom.xml configurations ... -->
</project>
```

**settings.xml**

```
<settings>
  <!-- other settings configurations -->

  <servers>
    <server>
      <id>remote repository id</id>
      <username>remote-repository-username</username>
      <password>remote-repository-password</password>
    </server>
  </servers>

  <!-- other settings configurations -->
</settings>
```

If we do not define the remote repository, then MAVEN during "mvn deploy" command we will face below error

```
[INFO] --- deploy:3.1.1:deploy (default-deploy) @ learningspringboot ---

```

If we want to deploy the manifest to Maven central repository : <https://repo.maven.apache.org/maven2>. Since its public, we do not need username and password in settings.xml
